

**Amendments to the Claims:**

This listing of claims will replace all prior versions and listings of claims in the application:

**Listing of Claims:**

---

1. (Currently Amended) A method for gathering data from memory of a computer system, comprising ~~the steps of~~:

following a plurality of memory element descriptors of a machine readable record list to locate data in the memory of the computer system, where each memory descriptor is descriptive of data to be retrieved from memory of the computer system;

gathering data specified by the plurality of memory element descriptors while maintaining data coherency; and

formatting the data into a buffer.

2. (Original) The method for gathering data from memory of a computer system of Claim 1, wherein at least one memory descriptor is descriptive of a list memory type, including location information of a head of a list and tag information for at least one data element to be gathered from a node of the list.

3. (Original) The method for gathering data from memory of a computer system of Claim 1, wherein at least one memory descriptor is descriptive of a scalar memory type.

4. (Original) The method for gathering data from memory of a computer system of Claim 3, wherein at least one memory descriptor is descriptive of a list memory type, including location information of a head of a list and tag information for at least one data element to be gathered from a node of the list.

5. (Original) The method for gathering data from memory of a computer system of Claim 3, wherein at least one memory descriptor is a list memory descriptor, including location information of a head of a first list, location information of a head of a second list in nodes of the first list, and tag information for at least one data element to be gathered from nodes of the second list.

6. (Currently Amended) A method for parsing a linked list to extract data therefrom, the linked list stored in memory of a computer system, comprising ~~the steps of~~:

constructing a record list, the record list comprising at least a first list element descriptor descriptive of data to be retrieved from a first linked list;

following a list head locator of the list element descriptor to a head of the first linked list;

following links of the head of the first linked list to a first node of the linked list;

interpreting at least one tag of the first list element descriptor to locate data of the node; and

extracting data from the node while maintaining data coherency.

7. (Currently Amended) The method of parsing a linked list of Claim 6, wherein:

the record list further comprises a second list element descriptor descriptive of data to be retrieved from a second linked list, and wherein a node of the first linked list contains a head of the second linked list; and

the method further comprises ~~the steps of~~:

following a list head locator of the second list element descriptor to a second list head of the node of the first linked list;

following links of the second list head to a node of the second list;

interpreting at least one tag of the second list element descriptor to  
locate data of the node of the second list; and  
extracting data from the node of the second list.

8. (Original) The method of parsing a linked list of Claim 7, further  
comprising the step of formatting the extracted data into a capture buffer.

9. (Currently Amended) The method of parsing a linked list of Claim 7  
further comprising ~~the steps of~~:

stopping execution of all threads executing on the computer system  
except for a thread parsing the list; and

resuming execution of all threads stopped during the step of stopping  
execution;

wherein the step of stopping execution is performed prior to the step of  
following links of the head of the first linked list, and the step of resuming  
execution is performed after the step of extracting data from the node of the  
second list.

10. (Currently Amended) The method of Claim 9, further comprising ~~the  
steps of~~:

following links of the node of the second list to a second node of the  
second list, and

extracting data from the second node of the second list according to at  
least one tag of the second list element descriptor.

11. (Currently Amended) A computer system comprising at least one  
processor, a memory system, and computer readable code recorded  
within the memory system, the code comprising computer readable  
code for:

receiving a record list, the record list comprising at least a first list element descriptor descriptive of data to be retrieved from a first linked list;

following a list head locator of the list element descriptor to a head of the first linked list;

following links of the head of the first linked list to a first node of the linked list;

interpreting at least one tag of the first list element descriptor to locate data of the node; and

extracting data from the node while maintaining data coherency.

12. (Currently Amended) The computer system of Claim 11, wherein:  
the record list further comprises a second list element descriptor descriptive of data to be retrieved from a second linked list, and wherein a node of the first linked list contains a head of the second linked list; and  
the computer readable code further comprises computer readable code for:

following a list head locator of the second list element descriptor to a second list head of the node of the first linked list;

following links of the second list head to a node of the second list;

interpreting at least one tag of the second list element descriptor to locate data of the node of the second list; and

extracting data from the node of the second list.

13. (Currently Amended) A symbolic debugger for accessing data of named executable modules of an operating system executing on a target machine, the operating system having version information, the symbolic debugger comprising computer readable code stored on computer readable media, the computer readable code comprising code for:

a collection driver for execution on the target machine;

a user interface capable of coupling to the collection driver; and  
a symbol resolution system capable of coupling to the user  
interface;

wherein the user interface comprises computer readable code for  
constructing an input record list containing records describing data to  
be captured, at least some records of the input record list containing  
information derived from symbols resolved by the symbol resolution  
system, and transmitting the input record list to the collection driver;

wherein the collection driver further comprises code for  
interpreting the input record list and collecting operating system data  
into a capture buffer specified by the input record list while maintaining  
data coherency, and transmitting the capture buffer to the user  
interface.

14. (Original) The symbolic debugger of Claim 13, wherein the  
collection driver is capable of interpreting a record of the input record  
list that specifies information to be gathered from multiple nodes of a  
linked list.

15. (Original) The symbolic debugger of Claim 14, wherein the  
collection driver is capable of interpreting a record of the input record  
list that specifies information to be gathered from multiple nodes of a  
linked list having a list head located in a node of a parent list, a list  
head of the parent list being specified by a record of the input record  
list.

16. (Original) The symbolic debugger of Claim 14, wherein the  
collection driver is capable of interpreting a record of the input record  
list that specifies scalar information to be gathered from designated  
locations of the memory system.

*Alma*

17. (Original) The symbolic debugger of Claim 14, wherein the collection driver further comprises a communications interface capable of receiving the record list over a network connection and comprises computer readable code for reading the version information from the operating system executing on the target machine.
